Before beginning any work, carefully read all safety instructions, and always observe them when working on or with the inverter. The installation must follow all applicable national or local standards and regulations. Consult with the local AHJ and/or utility to obtain the proper permits and permissions before installation.

Incorrect installation may cause:

- Injury or death to the installer, operator or third party
- Damage to the inverter or other attached equipment

3.2 IMPORTANT SAFETY NOTIFICATIONS

DANGER: Hazardous Voltage Circuits!

There are various safety concerns that must be carefully observed before, during, and after the installation, as well as during future operation and maintenance. The following are important safety notifications for the installer and any end users of this product under normal operating conditions.

1. **Beware of high PV voltage.** Install an external DC disconnect switch or breaker and ensure it is in the “off” or “open” position before installing or working on the inverter. Use a voltmeter to confirm there is no DC voltage present to avoid electric shock.
2. **Beware of high grid voltage.** Ensure the AC switch and/or AC breaker are in the “off” or “open” position before installing or working on the inverter. Use a voltmeter to confirm there is no voltage present to avoid electric shock.
3. **Beware of high battery current.** Ensure that the battery module breakers and/or on/off switches are in the “open” or “off” position before installing or working on the inverter. Use a voltmeter to confirm there is no DC voltage present to avoid electric shock.
4. **Do not open the inverter while it is operating to avoid electric shock and damage from live voltage and current within the system.**
5. Do not make any connections or disconnections (PV, battery, grid, communication, etc.) while the inverter is operating.
6. An installer should make sure to be well protected by reasonable and professional insulative equipment [e.g., personal protective equipment (PPE)].
7. Before installing, operating, or maintaining the system, it is important to inspect all existing wiring to ensure that it meets the appropriate specifications and conditions for use.
8. Ensure that the PV, battery, and grid connections to the inverter are secure and proper to prevent damage or injuries caused by improper installation.
9. Some components of the system can be very heavy. Be sure to utilize team-lift among other safe lifting techniques throughout the installation.

8. GENERAL INSTALLATION

This section provides detailed steps for assembling the cabinet, installing the batteries, and mounting the inverters.

WARNING:

To reduce the risk of injury, read all instructions! The assembly process requires working with heavy pieces, and the metal may contain sharp edges. It is highly recommended that at least two individuals be available to assemble the BOSSBox and install the batteries and inverters. Always wear the proper personal protective equipment (PPE) to avoid injury.

8.1 RECOMMENDED TOOLS

8.1 LOCATION REQUIREMENTS

Follow the installation requirements below to ensure all equipment is adequately supported and protected from extreme weather:

- Before installation, contact the AHJ for any clearances required by local laws and ordinances.
- EG4® recommends that the BOSSBox be placed on a level concrete pad capable of supporting at least 2,000 lbs. [With two inverters and three batteries, the weight is approximately 1,821 lbs. (826 kgs).]
- Avoid positioning the inverter attached to the BOSSBox in extended periods of direct sunlight.
- In hot climates, a shade structure is recommended if the inverter needs to be mounted in an area exposed to direct sun.
- If placed under a covered area, ensure a minimum of 15.8 in. (400 mm) above the inverter for ventilation. (see image 8.1.)
- If installed in a shed or a closed container, ensure proper ventilation is available for inverters. (Refer to the inverter user manual for more information.)
- Do not install in marine environments.
- If BOSSBox is installed in a floodplain, ensure that the installation location is elevated above the expected flood level to ensure it remains dry during flooding. Always consult flood zone maps and local building codes to determine the appropriate elevation installation.
- Maintain the minimum clearances to ensure all component wiring and controls are easily accessible to support routine operations and maintenance. (see image 8.2 on page 23.)

*For single inverter installations, a minimum of 6 in. from wall on the non-inverter side is required to access the rear anchor bolt. Local guidelines for spacing may supersede EG4® recommended spacing requirements.

8.2 CABINET, BATTERIES, & INVERTERS

Complete the steps outlined in this section to assemble the BOSSBox cabinet. The image below refers to the cabinet's front, left, and right sides. The doors that include the air intakes are referenced as the front of the cabinet, while the back doors do not use air intakes. The left door is also slightly wider than the right door.

1. Locate a supported location based on section 6.1. Use the cabinet base as a template to mark the location for the four anchor bolts. Drill a $\frac{5}{8}$ inch (16-mm) diameter hole at each mark, ensuring the holes are at least $1\text{-}\frac{9}{16}$ in. (40 mm) deep. Install an M12 anchor bolt in each hole. Carefully place the cabinet base over the anchor bolts and torque the nuts to 35 ft-lbs (48Nm).

Required Components:

- Cabinet base
- M12 anchor bolt (qty: 4)

2. Install the two inner walls. The inner covering is installed on one side, but all the screw holes are in identical locations, allowing the walls to be installed in any direction. Attach each inner wall to the base using eight M6x16 screws and eight M6x20 screws. The outer holes require the M6x20 screws, and the inner holes require the M6x16 screws. Torque each M6 screw to 54 in-lbs. (6Nm).

Required Components:

- Inner wall (qty: 2)
- M6x16 screws (qty: 8)
- M6x20 screws (qty: 8)

3. Install the two outer walls. The walls are identical and can be placed at either end of the base. Use four screws inside and four outside each outer wall, as shown in the images below. When inserting the four inside screws, ensure the shorter M6x16 screws are inserted in the middle two holes and the longer M6x20 screws in the outer holes. Torque each M6 screw to 54 in-lbs. (6 Nm).

Required Components:

- Outer wall (qty: 2)
- M6x16 screws (qty: 4)
- M6x20 screws (qty:12)

4. Install a battery bracket on each wall using six M10x25 screws for each bracket. The battery bracket is included with the battery, and the M10x25 screws are included with the BOSSBox. Verify that each battery bracket faces the same direction to ensure consistent battery polarity, which supports proper cabling. See section 7.3 for battery placement when installing less than three batteries. Torque each M10 screw to 168 in-lbs. (19Nm).

Required Components:

- M10x25 screws (qty:18)
- Battery mounting brackets (qty: 1 – 3)
(included with the battery)

5. Using the team-lift technique with a person on each side of the battery, slide the battery or batteries into place. **Do not mount the battery onto the battery bracket.** This will be done in step 7.

Required Components:

- Battery (qty: 1 - 3)

6. Set the top frame in place. Then, install the middle column brackets and screw each attachment point in place, as shown in the second image. Torque each M6 screw to 54 in-lbs. (6Nm).

Required Components:

- Top frame
- Top frame brackets (qty: 4)
- M6x20 screws (qty: 16)
- M6x35 screws (qty: 6)

7. Mount each battery on the bracket using the team-lift technique. After the battery is mounted on the bracket, extend the leveling feet on each battery. Install the side screws in the mounting bracket, two screws per side of each bracket. Torque each M5 screw to 26 in-lbs. 3Nm).

Required Components:

- M5x14 Battery bracket screws (qty: 4 – 12)
(included with the battery)

IMPORTANT:

There are two versions of the Wallmount AW battery. Only the battery with the adjustable feet is supported with BOSSBox. The battery with non-adjustable feet cannot be adjusted to support the weight of the battery and could cause damage to the mounting bracket and the BOSSBox.

8. Remove the black rubber plugs and install the inverter brackets with the provided M8x16 bolts. Ensure the bracket is centered on the outer wall. Then, employ the team-lift technique, ensuring one person is positioned on each side of the inverter to mount it securely onto the bracket. Torque each M8 bolt to 138 in-lbs. (15Nm).

Required Components:

- Inverter (qty: 1 – 2)
- Inverter wall mount brackets (qty: 1 – 2) (included with the inverter)
- M8x16 bolts (qty: 6 – 12)

Repeat this process for the installation of a second inverter.

9. Remove only the required knockouts and install conduit between the inverter and cabinet to protect the battery and communication cables. The upper knockouts align with the 12kPV, the FlexBOSS18, and the FlexBOSS21, while the lower knockouts align with the 18kPV.

Required Components:

- Conduit – (not included)

IMPORTANT:

Protect all cables in metallic conduit or raceways. Exposed cables are unsafe and violate the NEC code.

10. After the conduit is in place, install the L-brackets on each side of the inverter. Use the four screws included with the inverter to attach the L-bracket to the inverter. Use the included M8x16 bolts to attach the L-bracket to the BOSSBox outer wall. Torque each M8 bolt to 138 in-lbs. (15Nm).

Required Components:

- L-brackets (qty: 2 – 4) (included with the inverter)
- L-bracket inverter screws (qty 4 – 8) (included with the inverter)
- L-bracket M8x16 bolts (qty: 2 – 4)

11. Route the battery and communication cables as described in section 7.3 based on the inverter and battery quantity installed.
12. Verify that the six latches of the top frame are in the down position. Next, set the top cover in place and install the four M6x16 screws, one to each corner of the cabinet top. Lastly, use the six interior latches to connect the top frame to the top cover. Torque each M6 screw to 54 in-lbs. (6Nm).

Required Components:

- Cabinet Top
- M6x16 screws (qty: 4)

13. Install the doorstop on each side of the cabinet. The bracket should be installed with the flat side of the bracket towards the doors and the screw holes to the inside of the cabinet. Torque each M4 screw to 14 in-lbs. (1.5Nm).

Required Components:

- Doorstop (qty: 2)
- M4x10 screws (qty: 4)

14. Install the front and back left door panels. (1) Insert the bottom left corner of the door into the cabinet base. (2) Align the upper left corner of the door to the upper slot while pulling down on the spring latch. Once the upper corner is aligned, release the spring latch to secure the door. (3) Push the door closed while pulling in the upper and lower spring latches. Once the door is closed, release both spring latches to secure the door. The closeup images illustrate the spring latches located inside the doors.

Required Components:

- Left door (qty: 2)

15. Use the two M4 flange nuts to install the lock catch inside the front and back left door panels. Torque each M4 nut to 14 in-lbs. (1.5Nm).

Required Components:

- Lock catch (qty: 2)
- M4 flange nuts (qty: 4)

16. Install the right door panels on the front and back of the cabinet.
(1) Set the lower corner of the door on the base. (2) While holding the spring latch down, install the upper corner of the door, and then release the spring latch to hold the door in place.

Required Components:

- Right door (qty: 2)

17. Install the lock assembly in the right door panels using the M4x12 screws and M4 flange nuts, as shown in the callout image below. Torque each M4 nut to 14 in-lbs. (1.5Nm).

Required Components:

- Lock assembly (qty: 2)
- M4 flange nuts (qty: 8)
- M4x12 screws (qty: 8)

18. Install the air intake covers on the cabinet's front or back doors using fourteen M4x10 screws to secure each intake. Be sure to remove the air inlet knockouts (KO in the image below) on each door where the intake covers will be installed. Only remove the knockouts on the doors that use the intake covers. Torque each M4 screw to 14 in-lbs. (1.5Nm).

Required Components:

- Air Inlets (qty: 2)
- M4x10 screws (qty: 28)

19. Complete the installation by installing the AC output cables, AC input cables, solar panel input cables, and any other required cabling using the applicable EG4 manuals, which are linked below.

9. MAINTENANCE

To maintain the serviceable BOSSBox components, follow the steps below:

1. Inspect the door hinges to confirm they are operating smoothly. Add oil to the hinges as needed.
2. Lubricate the door lock as needed to ensure smooth operation.
3. Inspect and clean the air inlet filters as needed.
4. Touch up any areas of damaged paint to prevent corrosion.
5. Check for water intrusion after heavy rain, based on the installation location.
6. Check for pooling water at the BOSSBox installation location after heavy rain.
